

Project Brief

Social Media Comment Taxonomy Classifier

Goal of the session: A guidance and collaborative session for the Schola team to learn how to set up different functions within an AI tool to achieve a core objective, so we'll be able to independently set up and manage similar workflows ourselves in the future.

Project Scope

Overview:

Step 1: Automated Data Extraction *(Automatically pull comments from Schola's social media posts)*

Step 2: Analysis by Claude *(Classify each comment against our existing base taxonomy)*

Step 3: Output Delivery *(A structured dataset that can be sliced and analysed)*

Step 4: Run Report *(Summarise each cycle's results and surface outliers)*

Step 5: Review Loop *(Review of classifications to refine and maintain prompt quality)*

Step 1: Automated Data Extraction and Cleaning

- Connect to platform APIs:
 - **Instagram:** Instagram Graph API
 - **TikTok:** TikTok Research API

Credentials (for both):

Username: schola.my ; Password: Schola@2023

- Store raw comments in a Google Sheet tab. The following data fields are required per comment in the raw data pull:
 - Post URL
 - Comment text
 - Timestamp
 - Username (optional/anonymised)
- After extraction, any comment not in English (e.g. Bahasa Malaysia, Chinese) should be translated to English. The translated text is stored in a new column immediately to the right of the original comment column.
- **Final Output Fields:**
 - Post URL
 - Comment text
 - Comment text (EN)
 - Timestamp

Questions:

- *Scheduling: Can extraction be run on a set frequency, and can it also be triggered manually?*
- *Campaign-level filtering: Is it possible to run extraction only on posts belonging to a specific campaign?*
- *Account filtering: Can comments posted by the Schola account itself be excluded from the output?*

Step 2: Analysis by Claude

- Send all comments to an LLM with:
 - Comment text (EN)
 - Full taxonomy list (embedded in the prompt as reference)
 - A structured prompt asking it to return: Primary Intent code, Secondary Intent code (if any), Confidence level, short reasoning note

NOTE: Refer here for the [existing analysis prompt](#) we use on Claude.

- **Classification Output Fields:**
 - Post URL / ID
 - Platform
 - Comment Text (EN)
 - Primary Intent (Code)
 - Secondary Intent (Code)
 - Confidence
 - Reasoning Notes

Step 3: Output Delivery

Results are written to a Google Sheet with two tabs, structured as follows:

- Tab 1 = raw data pull & translation
Output of step 1: One row per comment, grouped by campaign.

Step 1: Automated Data Extraction				
Post URL / ID	Platform	Timestamp	Comment Text	Comment Text (EN)
Campaign: UPU Results Release				

tiktok.com/xyz	TikTok	2026-04-07 17:08:53	“Dh berjaya nanti je semua akan senyap”	“Once you succeed later, everyone will go quiet.”
instagram.com/abc	Instagram	2026-04-07 12:36:42	“ada panduan untuk isi upu betul” tak?”	“Is there a proper guide for filling in UPU?”
instagram.com/abc	Instagram	2026-04-07 12:52:02	“This helps students who are lost trying to find a scholarship for their studiess”	“This helps students who are lost trying to find a scholarship for their studiess”

- second tab = classified data output

Output of step 2: One row per comment, with taxonomy codes and confidence.

e.g.

Step 2: Analysis by Claude						
Post URL / ID	Platform	Comment Text (EN)	Primary Intent (Code)	Secondary Intent (Code)	Confidence	Notes
Campaign: UPU Results Release						
tiktok.com/xyz	Instagram	“Once you succeed later, everyone will go quiet.”	OTHER		MEDIUM	Could be career related but intent not clear
instagram.com/abc	Instagram	“Is there a proper guide for filling in UPU?”	2.3	—	HIGH	Request for guidance in applying for future pathways

Step 4: Reporting & Output Delivery

- After each cycle completes, a summary report is produced and **sent to a dedicated Slack channel**. The report covers:
 - Run date
 - Number of comments analysed
 - Number successfully categorised
 - Number of outliers (labelled as “OTHER”)

Step 5: Review Loop

- Current process:
 - Product team to check a sample of classifications each cycle
 - Edge cases and misclassifications feed back into refining the prompt
 - If taxonomy codes change (V3 → V4), Product team to update the prompt accordingly

Question: *What are best practices to run this feedback/improvement loop for the tool? To what extent is it possible to automate?*

Claude Prompt: Analysis of Qualitative Data

Existing taxonomy categorisation prompt for claude:

ROLE

You are an expert Qualitative Data Analyst specialising in career and pathway planning for students. You classify qualitative text (student messages, feedback, and questions) into the Schola User Intent Taxonomy with high precision and minimal over-interpretation.

The data is primarily from Malaysian students and will contain a mix of English, Malay, and "Manglish." Process and categorize based on the underlying meaning, without translating the text first.

TASK

For each row of student text, Identify the core underlying intent and tag them using the Schola User Intent Taxonomy below.

Determine the tag by reading the entire message first, then identifying the strongest underlying intent across the whole message, not simply the first topic mentioned.

TAXONOMY & CODES

PHASE 1: SELF & CAREER EXPLORATION

- 1.1 User has no clear direction and wants general career ideas or possibilities.
- 1.2 User has no clear direction and wants to understand themselves better (e.g. interests, strengths, or personality).
- 1.3 User wants tailored career suggestions based on their interests or preferences.
- 1.4 User is evaluating whether career suggestions & information about jobs are accurate, relevant, or "fit them".
- 1.5 User wants factual information about a job, field/industry, or role.
- 1.6 User confirms or affirms a chosen career goal.

PHASE 2: PATHWAY PLANNING

- 2.1 User has no clear direction and wants general pathway options or next steps.
- 2.2 User wants tailored pathway (e.g. courses, training, skills or certifications) suggestions based on their career goals, preferences, or constraints.
- 2.3 User wants factual information (e.g. duration, requirements, cost, etc.) about a specific pathway they have in mind.
- 2.4 User is evaluating which pathways (e.g. courses, training, skills, or certifications) suit them.
- 2.5 User confirms or affirms their pathway (e.g. courses, training, skills, or certifications) plan.

PHASE 3: EXECUTION

- 3.1 User is looking for actual job vacancies or execution steps to get a job.

PHASE 4: EMOTIONAL SUPPORT

4.1 User needs encouragement, reassurance, or confidence-building in their career exploration & pathway planning.

CLASSIFICATION RULES

1. **PRIMARY TAG (REQUIRED):** Every item gets ONE primary tag/code. If a message contains multiple intent, select the intent that represents the main purpose or dominant intent. Even for messages that appear as a feedback, content/feature requests, UX suggestions, testimonials, praise, etc. identify the underlying intent from Phase 1-4 and tag the category accordingly. For example: - "I wish Schola had more subjects to match" → unmet Phase 1 exploration need (1.3), not platform feedback - "This website helped me find my dream job" → confirmed career goal (1.6), not a testimonial - "Please come to my school to talk about careers" → general career exploration need (1.1), not just an outreach request. Intents should be tagged not only when a user expresses a desire to achieve something, but also when the message indicates they have already achieved it. For example, "I found a job!" is tagged 3.1 just as "how do I find a job?" is.
2. **SECONDARY TAG (OPTIONAL):** Use this column only when the message has a second distinct intent from Phase 1-4 and tag accordingly. Intents should be tagged not only when a user expresses a desire to achieve something, but also when the message indicates they have already achieved it. For example, "I found a job!" is tagged 3.1 just as "how do I find a job?" is.
3. **CONFIDENCE LEVELS:** Add a column to assign confidence level.

- ****HIGH**** — the category is explicit or strongly implied by the text itself
- ****MEDIUM**** — reasonable inference is required to reach the classification
- ****LOW**** — significant ambiguity; the chosen code is a best guess among several plausible options

4. **OTHER CATEGORY:** Use OTHER when a message does not fit clearly within Phase 1–4 categories.

Examples may include:

- scholarship discussions without broader career intent
- platform feedback unrelated to career decisions
- education topics outside the defined taxonomy

5. **SCHOLARSHIPS RULE:** If a message is primarily about scholarships, tag Primary Intent as "OTHER". Exception: if a clear Phase 1–4 intent is dominant, use that as Primary and scholarships can be noted in Secondary if it maps to a taxonomy code.

OUTPUT FORMAT

Generate a sheet and markdown table with the following headers:

| Original Text | Primary Intent | Secondary Intent | Confidence | Notes/Reasoning |

Column rules:

****Original Text****

- Copy the exact verbatim input text from the dataset.
- Do not paraphrase or modify the text.

****Primary Intent****

- Assign one taxonomy code only (e.g., 1.6, 2.2, 3.1, 4.1, OTHER).
- This represents the dominant intent of the message.

****Secondary Intent****

- Assign a second taxonomy code only if the message clearly contains a second distinct intent.
- Otherwise leave it empty.

****Confidence****

- Choose one: HIGH, MEDIUM, or LOW

****Notes/Reasoning****

- Provide one concise sentence explaining the classification.
- Especially explain cases with MEDIUM or LOW confidence.

Informatic Items

Informatic Items

1. Posts date to pull from (depending on approach):
 - Specific time frame: Aug 2024 to date
 - Frequency-based: Weekly
 - Campaign-based:
 - <https://www.instagram.com/schola.my/reel/DX3JJ1vSTmW/?hl=en>
 - <https://www.instagram.com/schola.my/reel/DX06r29v8lF/?hl=en>

 - <https://www.instagram.com/schola.my/reel/DXvkvAwyJX8/?hl=en>
 - <https://www.instagram.com/schola.my/reel/DXqcfEnD3km/?hl=en>
 - <https://www.instagram.com/schola.my/reel/DXoNkf0Do1B/?hl=en>
 - <https://www.instagram.com/schola.my/reel/DXIY2mzD83W/?hl=en>
 - https://www.instagram.com/schola.my/reel/DXixZrqD_4U/?hl=en
 - <https://www.instagram.com/schola.my/reel/DXgRPb3D6uO/?hl=en>
 - <https://www.instagram.com/schola.my/reel/DXbjzmaj0TK/?hl=en>
 - <https://www.instagram.com/schola.my/reel/DXY9TJPjxUs/?hl=en>
 - <https://www.instagram.com/schola.my/reel/DXWdfv5Dyon/?hl=en>
2. Social media platforms:
 - a. Phase 1: Instagram
 - b. Phase 2: Tiktok, Threads (depending on access limitations)
3. Taxonomy version: current taxonomy for students' messages on Schola)

Code	Phase	Taxonomy
1.1	Self & Career Exploration	User has no clear direction and wants general career ideas or possibilities.
1.2	Self & Career Exploration	User has no clear direction and wants to understand themselves better (e.g. interests, strengths, or personality).
1.3	Self & Career Exploration	User wants tailored career suggestions based on their interests or preferences.
1.4	Self & Career Exploration	User is evaluating whether career suggestions & information about jobs are accurate, relevant, or “fit them”.
1.5	Self & Career Exploration	User wants factual information about a job, field/industry, or role.

1.6	Self & Career Exploration	User confirms or affirms a chosen career goal.
2.1	Pathway Planning	User has no clear direction and wants general pathway options or next steps.
2.2	Pathway Planning	User wants tailored pathways (e.g. courses, training, skills, or certifications) suggestions based on their career goals, preferences, or constraints.
2.3	Pathway Planning	User wants factual information (e.g. duration, requirements, cost, etc.) about a specific pathway they have in mind.
2.4	Pathway Planning	User is evaluating which pathways (e.g. courses, training, skills, or certifications) suit them.
2.5	Pathway Planning	User confirms or affirms their pathway (e.g. courses, training, skills, or certifications) plan.
3.1	Execution	User is looking for actual job vacancies or execution steps to get a job.
4.1	Emotional Support	User needs encouragement, reassurance, or confidence-building in their career exploration & pathway planning.
	OTHER	

4. Confidence threshold: AI's self-assessment of its own taxonomy labeling certainty.
 - a. Low: The comment is vague, too short, too noisy, or pulls in multiple directions such that any label assigned is more of a best guess than a real classification.
 - b. Medium: The comment is probably a certain intent, but there's some ambiguity
 - c. High: The comment maps clearly and unambiguously to a taxonomy code
